

Level 1 - AI Reflection

What AI tools did you use?

- I used the copilot assistant in vscode

What did they get right or wrong?

- Funnily enough it kept trying to make the program in python at first. But other than that It implemented the abstract class and interfaces pretty well.

What changes did you make and why?

- Did not make any noticeable changes other than fixing the language issue

Level 2 - AI Reflection

Submit your AI prompt(s) and output for at least one part of your expansion

- Add a third shape (Triangle) to both designs. I also want you to use a shared interface (Describable) between both designs to add descriptions to all shapes

Explain what you kept, improved, or discarded

- It had a hard time keeping the projects separate, so it kept implementing the interfaces into files where I didn't want it to, so I went ahead and set up the packages early to help make it easier to navigate. I also set up a package for the polymorphed interface, that way I knew where it was.

Level 3 - AI Reflection

Use AI to help write the README or JavaDocs

- I used it for the JavaDocs, It was spouting nonsense for the README

Did AI's output show accurate technical understanding?

- For the Javadoc, yes. I didn't really have to change any it.

How did you revise or critique its language?

- I don't recall revising any of the language. If I did it was just to simplify what it was trying to say.
